IP-EIGRP is responsible for parsing EIGRP packets and informing DUAL of the new information received. IP-EIGRP asks DUAL to make routing decisions and the results of which are stored in the IP routing table. IP-EIGRP is responsible for redistributing routes learned by other IP routing protocols. EIGRP Concepts Introduction to EIGRP - Cisco Enhanced Interior Gateway Routing Protocol (EIGRP) is an interior gateway protocol suited for many different topologies and media. In a well designed network, EIGRP scales well and provides extremely quick convergence times with minimal

network traffic. EIGRP Theory of Operation. Some of the many advantages of EIGRP are: Enhanced Interior Gateway Routing Protocol - Cisco Enhanced Interior Gateway Routing Protocol (EIGRP) is an advanced dynamic routing protocol that is used for routing decisions and configuration on the routers. EIGRP was developed by Cisco Systems as a proprietary protocol, which can be used only on Cisco routers but in 2013 partial functionality of EIGRP was converted to an open standard. EIGRP only sends incremental updates, reducing the workload on the router and the amount of data that needs to be transmitted. Understanding Basics of EIGRP Routing Protocol EIGRP can be used not only for Internet Protocol (IP) networks but also for AppleTalk and Novell NetWare networks. Using EIGRP, a router keeps a copy of its neighbor's routing tables. If it can't find a route to a destination in one of these tables, it queries its neighbors for a route and they in turn query their neighbors until a route is found.
