passed down through families, there are three terms to refer to these generations. Monohybrid and Dihybrid Punnett Squares A Punnett square is a simple method for determining the theoretical ratios of genotypes and phenotypes that would occur in the offspring of a cross between two parents. A monohybrid cross is when you are only looking at the genetic outcomes for a single gene.

Monohybrids and the Punnett Square Guinea Pigs - YouTube A Punnett Square for a tetrahybrid cross contains 256 boxes with 16 phenotypes and 81 genotypes. A third allele for any one of the traits increases the number of genotypes from 81 to 108. Given this complexity, Punnett Squares are not the best method for calculating genotype and phenotype ratios for crosses involving more than one trait.
